Retention after the first order stays below 1% in every cohort

Rows = month of first purchase.
Columns = months since first purchase.
Values = % of that cohort who bought again.

6.	Champions	1,201	322.81	R$ 387,701	2.51%

1 - 6 / 6

-- Champions: 2+ orders, bought recently
-- Repeat – At Risk: 2+ orders, not recent
-- New Big Spenders: 1 order, recent, high spend
-- New Customers: 1 order, recent, lower spend
-- Need Attention: 1 order, medium recency
-- Inactive One-Timers: 1 order, oldest purchases

--Recent = bought within the last 177 days
--Medium recency = last bought 177–268 days ago
--Oldest =last bought more than 268 days ago
--High spend = paid more than R$132.7

****Segment rules are my own design, not an industry standard.**

What I'd recommend

1. **Target the 14,404 New Big Spenders (avg R$302) with a second-purchase offer within 30–60 days of their first order.**
2. **Run an A/B test (offer vs no offer) and measure the second-order rate before rolling it out.**
3. **Treat win-back of inactive one-timers as a small experiment, not a main bet.**

Scenario (illustrative assumption)

Raising the repeat rate from 3% to 4% means about 930 more repeat customers. At the average R$165 per customer, that's roughly R$154k, about 1% of total payments.

Limitations

Data covers only two years, one Brazilian marketplace, no marketing or channel data, payments include freight, and the segment thresholds are my own choices.
